

It's taper time – our top tips!

Here are our top tips to tackle the final stages of your 10 mile race training;

3 weeks out

- The training you do today takes 2-3 weeks to have a real long-term effect on fitness so you can see immediately that 2 weeks out from a your race we can reach a point of diminishing returns if you are not careful.
- Focus now begins to turn towards on protecting your fitness and feeling great on race day. You can use the final weeks to sharpen up slightly with a couple of shorter faster sessions and even a 5k parkrun (www.parkrun.org.uk).
- If you want a confidence boost 3 weeks out from your race can be a good time to include a 5km or 10km in your training plan and aim to run some or all of it at your planned 10 mile race pace.
- Run your longest 10 mile race training run should be 3 weeks out from race day. A top session could be 90 minutes with the final 45 minutes to include 3 x 10 minutes at your planned race pace.
- For the more experienced runner looking to run over distance and including faster efforts in your key long run is a good option. An example would be 25km run as 5km easy / 5km at threshold (a controlled discomfort or 3-4 word answer effort) effort / 5km easy / 5km at threshold effort / 2km hard / 3km easy.
- One week before its time to run just 60-70 minutes easy and enjoy the Sunday papers!
- All your other training needs to remain the same 3 weeks out, although

do have a couple of easy or rest days after that longest run.

- Your last key harder session should be about 10 days before race day. For example;
 - 45-60 minutes with 6 x 5 mins @ threshold off a 60s jog recovery. Threshold effort is a controlled 3-4 word answer effort – don't worry too much about the pace...
 - 10 minutes at 'threshold' effort + 5 x 2 mins @ 5k pace + 10 mins at 'threshold' effort all with a 2 min jog recovery.

45 minutes with 8 x 3 mins @ with the odd numbers at threshold effort, even at 5km pace (faster than threshold) off a 90 second jog recovery.

One week away!

- This is when the gremlins starting talking to you - 'have you done enough training?', 'should you squeeze in one more fast session?'. These are common worries but this week but less becomes more. It's time to let the body start to recover and build its strength for race day.
- The final week is a crucial time all those tough weeks of training need to count now by looking after yourself and your body
- Our big tip though is don't taper too much...yes you can have too many rest days and then feel sluggish by race day.
- Your body loves routine so try for a 30 minute easy and relaxed run on the same days you would normally run, chatting with mates or along a favorite route.
- Don't chase time or worry about the GPS stats just run easy and keep relaxed.
- If you feel strong then consider a light session on the Tuesday, for example 30 minutes including 3 x 5 mins at 10 mile race pace off a 2-3 minute jog as recovery. You are just keeping your legs used to a little pace and feeling faster.
- We often advise runners to jog for 10-20 mins the day before the race

and stretch. It helps you to feel loose on race day and can calm the nerves a little. However, always practice what you are used to in race week and the day before. If you usually rest then definitely do this.

- Let's be totally honest here, the nerves will kick in at some point - this is a good thing. It's totally normal but we need to get things in perspective. Take time out in the week at some point and review your training over a coffee. Remember your best long runs, sessions and maybe a 10km that went well.
- It's time to remember the positives and you can draw on these on race day. Surround yourself with positive, supportive people and those that enjoy the challenge and are excited by the thought of race day.
- Sleep and rest - you always need to respect this key element as a runner if you want to improve. Try to get a few early nights in race week and definitely protect that immune system in the final weeks, as late nights and picking up a cold will wreck race day.
- Avoid heavy strength and conditioning or gym work this week and don't fall into the trap of using all that extra time to start DIY projects or wander town sightseeing!
- Plan your travel on race day with a few days to spare.

Nutrition – getting it right through your last week!

- We see so many runners getting this wrong during the taper ruining months of hard work. It's all actually really simple - just eat normally and gradually reduce the volume and intensity of your training – this is a natural carb load. You don't need to do anything specific for a 10 mile race as a 'carb load' is not really needed. Eat well, snack regularly and feel energized this week!
- Your body needs the quality calories to keep your glycogen (carbohydrate stores) topped up and you feeling great in training and on race day.
- Our simple catch phrase is 'never hungry, never over full' and grazing throughout the day with snacks and sensible main meals will work well for you.

- Our top nutrition tip is to eat your normal pre race or pre long run breakfast. Don't suddenly change what has worked so well for you in training.
- You want your body to feel normal and comfortable on the start line...it's not the time to suddenly try porridge or some wonder meal if you are not used to this!
- Don't stuff yourself silly on the night before the race; it will only leave you feeling sluggish on race day.

The final 24 hours

- Consider a light 15-20 minute jog in the morning the day before the race to help ease tension and to warm up before stretching.
- Take a look at the weather forecast for race day and wear whatever is going to keep you cool and comfortable.
- Pack your kit bag with all that you will need on race day – pins, warm clothes, toilet paper, Vaseline, snacks, fluids, iPod and ensure your number is pinned on your vest and chip on your shoes.
- Snack on small meals throughout the day and stay well hydrated.
- Eat your last main meal at 6-7pm and snack on easily digested carbohydrate snacks afterwards if needed.
- Get to get early! If you find it hard to sleep don't worry – this is normal but stay in bed and rest, read and relax.

Race day!

- Wow it's finally here and now it really is time to keep your head. Time to remember those 3 runs that went well in training that you have banked or the cause and reason for which you are racing.
- Wake early, shower, and take a few moments to breathe deeply, relax and stay calm.

- Eat the race day breakfast you have practiced in training before you long runs 1.5-2 hours before race start
- Keep your kit simple and wear the shoes you ran your last few long runs in and make sure any clothing has been worn and washed a few times before you race in it, don't try anything new.
- Take a carbohydrate-based snack (for example a banana or energy bar) and sports drink to snack on between breakfast and race start and be prepared with fuel in case of a delayed start.
- Look around you and focus in on the target you have set. Remember your pace, split times and don't rely on your GPS...they often fail with so many signals in the same area. Have your splits per mile written on your hand, arm in permanent ink or on a wristband.
- Sip your final mouthfuls of water/sports drink but don't take on more than normal, you don't need it.
- Don't run to warm up or do any high intensity drills – save your energy and use the first few miles to warm up. An easy 10-15 minute jog is plenty enough to get the legs turning over.
- Hand your kit in and perhaps have an old tracksuit and bin liner or previous race foil blanket on to stay warm, and head to your pen 20-30 minutes before the start. In the final minutes take your old kit off.

Your race strategy

- As the gun goes, count to 10 and slow down if you are on a faster start.... you really need to ease into your race day pace in the first few km's rather than running too quickly.
- Run at the pace you have practiced. After building into the pace you should then look to lock into the km or mile splits that became familiar to you in the marathon pace sessions and longer runs.
- Definitely don't try to bank faster miles and get ahead of the schedule. Whilst is not a marathon it's still perfectly possible to 'blow up' and hit a wall in a half if you get greedy in those early miles. Feel good to half way!

- You're goal should be to aim to run the final 5 miles at the same pace or faster than the first – concentrate to balance your effort and feel controlled in those early miles.
- Sip on sports drink and/or water occasionally in the race. You don't need too much and be sure to not over drink on the way round.
- Remember to smile, take time to relax and draw in the atmosphere!

So taper well and remember...less can be more! Good luck everybody.
